

EXPLANATORY NOTE

Scientific and technical justification of the author's proposal on verification of Social Registry calculations. Revised 1 October 2026; calculation reference date: 30 September 2026. English companion to the primary Russian submission. Material 2; Material 1 contains the proposed norms and Material 3 the detailed research and electronic computational supplement.

Basis for preparation, developers and purpose

Paragraphs 13–14 of PF-193 provide for multidimensional assessment from 1 January 2027 and submission of the relevant draft to the Presidential Administration by 1 December 2026. The official developers are the National Agency for Social Protection under the President of the Republic of Uzbekistan and the Ministry of Economy and Finance of the Republic of Uzbekistan. This note accompanies the author's proposal by Abduxolliq Akmal ugli Ashuraliyev; it is not submitted on behalf of an official developer.

The purpose is to recalculate the approved assessment rule from identical inputs, check boundaries and exceptions, distinguish data problems from software errors, and explain individual decisions. The core proposal consists of seven operative provisions and a 28-paragraph annex. It does not itself set the new 2027 scores or assistance amounts. The expected result is a calculation that can be verified and reconstructed; no quantitative forecast of family welfare, budget savings or assistance coverage is provided. A five-paragraph compact alternative is also supplied to replace the full form, without cumulative application.

The legal form will be determined within the principal draft. An option affecting criteria in PF-258 requires amendment of the Presidential act. A Cabinet of Ministers act or software setting cannot replace a criterion of higher legal force.

Regulatory subject and structure of the proposed act

The principal decision is mandatory checking of the execution of approved rules, rather than selection of a new need model. Seven operative provisions cover approval, one methodology description, reproducibility, Article 22 drafting organization, consequential reconciliation, resource accounting and readiness before use. The annex has seven chapters: general provisions (paragraphs 1–3); descriptions and versions (4–7); data quality and outages (8–11); calculation checks (12–17); grounds and review of decisions (18–20); research, reporting and oversight (21–24); acceptance, correction and retention (25–28). Material 1 contains the normative requirements; this note explains purpose and implementation, and Material 3 supplies detailed evidence.

The proposal concerns subordinate implementation of the PF-193 mandate. Paragraph 84's requirement to examine moving subordinate regulation to statutory level applies when preparing a draft Law; no separate draft Law is proposed here. The competent body chooses the principal instrument. A new entitlement or

payment amount requires the competent legal rank. Calculation verification does not replace that authority.

Necessity of each requirement block

The existing duties of proper operation and timely provision of information in Resolution No. 35 annex 1 paragraph 46 are the starting point. The proposed procedure makes their execution checkable: a particular version identifies the applied rule, input basis, component comparisons and person resolving a discrepancy. The same paragraph's duties of the applicant, social worker and "mahalla seven" remain; state-source responsibility is not shifted to the family.

Criterion passports and dated versions are needed because the same number with different units, periods or inclusion rules is not the same input. Separate quality states prevent an absent record becoming confirmed zero income or later receipt becoming presumed greater reliability. Exception and precedence checks prevent a correct general formula from producing a wrong result through omission of a special condition. Component comparisons detect errors cancelling in the total. Individual explanation and linked correction establish the particular decision ground and lawful review, rather than merely statistical reporting.

The Procedure establishes minimum required information and actions. The Agency may define internal passport, protocol and journal forms without changing a criterion, application period or refusal ground. If the developer identifies an equivalent existing requirement and an operationally supported control, the clause is integrated with it. A general reference to an information system or oversight does not resolve demonstrated questions of units, boundaries, exceptions and explanation.

Clause-by-clause choice of legal instrument

Article 20 of O'RQ-682 requires testing whether existing mechanisms and administrative powers suffice. The PF-193 mandate establishes a drafting task, not proof that every proposed control needs a new norm. In this table, P denotes a proposed public duty or power requiring competent normative adoption; C denotes consolidation of an existing duty, to be merged rather than duplicated where equivalence is demonstrated; I denotes implementation within existing powers. Mixed entries separate the public minimum from its internal execution. These are the author's reasoned classifications, not an official finding that the Agency lacks powers. Resolution No. 35 annex 1 paragraphs 45–50 and personal-data Articles 11 and 24 are relevant existing mechanisms.

Provision	Choice	Why and disposition
Operative 1	P/I	Adopt the public minimum; delegate technical forms. No need for a separate act merely to rename an existing control.
Operative 2	P/C	Eligibility rules need competent approval; the description cannot independently change them.

Provision	Choice	Why and disposition
Operative 3	C/I	Proper system operation and legal periods already apply; use existing authority for testing.
Operative 4	C/I	Article 22 organization and internal technical regulation; no external qualification or new citizen duty.
Operative 5	C/I	Reconcile approved rules and procedures; no reserve-entry power or change of commencement.
Operative 6	C/I	Identify incremental tasks, existing coverage and actual funding; no duplicate procurement.
Operative 7	C/I	Reuse release evidence and required approvals; no new public-report launch gate.
Annex 1	I	Scope and a linked control set; organize existing system responsibility.
2	I	Definitions ensure consistent execution; no independent entitlement.
3	C	Category and benefit conditions remain distinct; preserve sector rules.
4	I	Passport and source detail moves to the internal technical regulation.
5	P/I	Public criteria must resolve equality and precedence; software checks their execution.
6	I/C	Version identity and legal dates support reconstruction under existing operation and data duties.
7	C/I	Link the published approving act and lawful description on the existing resource; internal version record.
8	I/C	Source trace supports lawful reasons and data accuracy; schema is internal.
9	P/C	Missing data is no new adverse ground; lawful imputation remains possible.
10	P/C/I	Competent clarification, period protection and no new refusal; internal routing forms are delegated.
11	C/I	Record the existing outage power; do not extend its legal scope.
12	I	Independent controls, coverage and case reconciliation implement lawful operation.
13	I	Prespecification controls interpretation of results; it creates no applicant duty.
14	I	Numerators and denominators govern report quality, not eligibility.
15	I	Claims of need accuracy require suitable evidence; no empirical study is made a launch condition.
16	I	Protocol evidence and formats belong in the internal regulation.
17	C/I	Correct defects and locate affected decisions; individual changes require existing lawful powers.
18	C/I	Preserve accessible decision grounds; technical trace format is internal.
19	P/C	Existing explanation rights are consolidated; a specific accessible calculation explanation supplements SMS.
20	C/I	Preserve statutory objection and correction periods; add no compulsory pre-court stage.
21	C/I	Existing lawful processing and special-data conditions; research permission is internal.
22	C/I	Protected execution and disclosure control; no external personal-data access.
23	C/I	Internal protocol and existing lawful disclosure/access; no new periodic or per-release public report.
24	C	Use existing oversight powers; no new inspection body or payment-reduction ground.
25	I/C	Existing release record links legal and technical evidence; mandatory external conclusions remain.

Provision	Choice	Why and disposition
26	C/I	Repair/retest affected software paths or lawfully retain a conforming build; no expired-rule or manual fallback.
27	C	Applicable dates and lawful individual review; no transition-debt exemption.
28	C/I	Apply lawful retention and destruction; category schedules are internal.

Necessity of normative content and limits of a technical solution

What must be justified. Paragraphs 13–14 of PF-193 introduce multidimensional point-based classification and mandate a normative draft. They directly support work on the 2027 normative content, but do not establish that a separate testing act or all 28 author clauses are indispensable. The proposal seeks incorporation into the already mandated act; Material 1 supplies a five-paragraph compact alternative. No 2027 scores, weights or complete parameter set have been invented here; the developer must determine them lawfully.

Why a technical solution cannot substitute for a legal one. Articles 3, 14, 17, 18 and 37–40 of O‘RQ-682 distinguish normative content, competence, legal hierarchy, required form, registration where applicable and official publication. Where a threshold, equality treatment, period, permissible input or imputation itself establishes an inclusion or refusal condition, a successful test alone cannot justify that choice. Testing asks whether the chosen rule is executed; the competent instrument supplies the legal basis for applying that rule to a family. This is the author's inference from those provisions, not a claim that every software parameter requires separate normative approval. Existing lawful delegation and technical execution of an already determined condition remain.

Distinguishing instruments. Paragraphs 94–95 of the Rules registered as No. 3686 on 9 October 2025 cover departmental normative acts affecting rights and safeguards, interagency acts and acts binding organizations outside the adopting body's system. Paragraph 96(b) excludes implementation documents containing no new legal norms; paragraphs 96(v)–(j) provide technical exceptions, including Ministry of Justice classification of other documents. Calling a document a technical requirement therefore does not settle its legal character. Conversely, an actual technical document does not become normative merely because of this proposal. These rules concern the departmental form; they do not require state registration of Presidential or Cabinet acts. The version incorporating the 17 September 2026 amendments was checked; paragraph 20 expressly requires examining necessity and alternatives.

Two independent equivalence conditions. Legal coverage identifies the exact provision, competent body, legal rank, covered families/cases, applicable dates and binding consequence, with applicable registration/publication for a departmental instrument. Technical coverage identifies inputs, dates, exceptions, independently justified expected answers, tested version and executed results.

Coverage of all author tests removes the need to repeat those tests. It removes the need for an additional norm only if the legal content is also fully secured. A general contract, audit, group-appointment order or acceptance protocol is not evidence of a missing criterion. Where both coverages are established, no additional norm is proposed for that issue.

Applicability restrictions and interpretation. A competent interpretation of an existing condition or documented source-data domain may resolve a particular counterexample. The source, authority, period, units and actual field semantics are identified; the mathematical conclusion is then restricted to that domain. Current software rejection of a value does not itself prove that a family is legally barred from presenting the corresponding fact. A new eligibility restriction cannot be inserted as purported evidence of an impossible input. Under O'RQ-682 Article 55, interpretation cannot amend, supplement or correct an act. Clarified meaning requires consistent execution; a new choice of legal condition requires competent amendment. A resolved issue is not retained as an artificial reason for new regulation.

An expressly existing temporary power. Resolution No. 35 annex 1 paragraph 48 covers technical faults, interruptions and incomplete receipt of electronic information. It permits the Agency to suspend exchange in individual systems until full restoration and change the automatic category algorithm. Consequently, this submission does not assert that every temporary algorithm change requires a new act. Compact paragraph 4 and full paragraph 11 preserve that power and propose traceability of its particular exercise. The developer reconciles its application to the new methodology; paragraph 48 is not treated as determination of the entire permanent 2027 scoring system.

Cost and choice sequence. The mandated draft first determines lawful assessment conditions and retained safeguards, alongside comparison of existing tests and contracts. Only uncovered integration is then costed. The compact text creates no new application-processing stream or national manual service. Legal drafting, running tests and interface changes still require time; neither absence of a separate appropriation nor a promise of internal execution proves zero cost. Actual hours, contract coverage, capacity and financing remain unverified. A substantiated resource difficulty may change technical detail and task allocation, but does not legally authorize software to supply a missing assistance condition.

Adoption criterion. Different ordering, shorter wording, a reference to current law or a properly authorized departmental normative act are acceptable. Each legal task is checked for the same binding consequence, source, dates and competence; each technical task for its operator and equivalent evidence. This mapping is requested for discussion, not asserted to be a new mandatory form of governmental reply. Equivalent wording in a competent published act is normative uptake without a separate annex. Incorporating cases only into technical requirements is technical uptake; it does not dispose of demonstrated unresolved normative content.

Objection	Sufficient evidence	Disposition
Existing controls cover the cases	Applicable norm and independently justified executed checks for the same scope and dates	Omit duplicate tests; consolidate the norm only where legal coverage is established.
Counterexample outside scope or resolved	Authoritative restriction or competent interpretation, applicable date and input semantics	Restrict or retire the case; a new legal restriction requires a competent instrument.
Additional work	Specific uncovered task, hours, contract, funds and relevant workload if processing changes	Make technical integration proportionate; do not replace the legal condition with a setting.
Different drafting choice	Same competence, binding consequence, scope, dates and workable channel	Accept compact or equivalent normative wording as uptake; verbatim author wording is not an end in itself.

Minimum adoption route. Incorporate necessary legal conditions and assessment-specific safeguards into the mandated act; Material 1 supplies a five-paragraph compact alternative. The full seven provisions and annex are another form, not cumulative demands. Acceptance tests and detailed forms use existing powers and equivalent records. Technical uptake of scientific cases is sufficient for the engineering task where legal coverage is separately established. It does not substitute for adoption of a missing legal condition. Shortening or cross-reference is acceptable where competence, binding consequence, scope, dates, access and statutory periods remain.

Evidence and the narrow remedy it supports

Completed evidence	Supported narrow remedy	What it does not establish
Income equality and hardship controls	Reconcile equality, exception priority and legal expected answers.	Frequency of inconsistent production decisions or superiority of an inclusive boundary policy.
620 negative land results in 4 105 constructed rows	Confirm authoritative geometry/domain and decide the legal formula before coding; test the selected rule.	620 affected families, national incidence, or net benefit of a zero floor.
Official income example: 432 000 soum	Check units, household divisor and reference period against the legal example.	General correctness of the production system.
Tax, livestock and conditional remittance controls	Preserve branches, units and dated parameters in reference checks.	The Agency's implementation, full 2027 specification or real-data quality.

Completed evidence	Supported narrow remedy	What it does not establish
37 regression tests and frozen-inventory checker	Supply a reproducible control tool and prevent omitted/duplicated constructed cases.	Production acceptance, available Agency staff or savings.

The completed controls establish questions to resolve and check, not measured additional benefit over the Agency's implementation. Necessity is assessed against its rule specification, independently justified expected answers, release evidence, lawful explanation route and existing technical/security conclusions. An equivalent implemented control is reused; only an identified uncovered task is additional. No household data need leave the Agency. An authoritative domain restriction may exclude a constructed input. Broad welfare validation remains separately scoped. A new public statistical-reporting programme is not requested.

Internal technical specification retained outside the normative annex

This section is the author's implementation specification for the internal regulation in operative paragraph 4. It is not an additional public criterion, applicant obligation or source of authority to modify law.

Criterion and source passports. Record a stable criterion identifier, legal rule, type and domain, source owner and record identifier, unit, required status, reference-date boundaries, updating rule, transformation, duplicate/overlap treatment, conflict selection, lawful imputation, order of operations and intermediate precision. Remittances and comparison thresholds use the same unit and period; household membership and changing remuneration parameters use their applicable dates. Receipt time is not the fact's reference date. Preserve both conflicting values and the lawful selection basis. Record a staff correction's author, time and authority.

Control inventory. Link each applicable condition, boundary, exception, precedence rule and reachable interaction to cases. Each case records its identifier, inputs, preconditions, effective date, legally derived intermediate and final expected values, derivation and independent checker. Compare the planned and executed identifiers and multiplicities; explain exclusions and inapplicability. Check empty inventories and undefined denominators explicitly. A changed rule or source mapping triggers affected and interacting-path checks; if the effect cannot be bounded, check the whole applicable chain. A shared program output is not an independent legal answer.

Protocol and remediation. Preserve methodology, software and configuration identities separately, data period and composition, inventory and scope, expected/actual components, executed and excluded counts, discrepancies, effects, corrective owner and retest. Distinguish rule conformity, data quality and decision-ground completeness. A defect record links affected versions, dates and applications, not just the complaint revealing it. A clarification record links

the original receipt, source or competent recipient, legal period, reply, corrected calculation and notification. Protected records stay inside authorized storage; the public extract contains only disclosure-checked aggregates.

Launch conformity without a new entitlement transition

Paragraph 26 now concerns repair, retesting and lawful software release management. It does not require a second manual decision service. A previous build may operate only if it executes the rule legally applicable to that decision and its controls and operational suitability are verified. A build carrying a superseded income rule is not a lawful fallback merely because it passed older tests. Outage measures remain confined to Resolution No. 35 annex 1 paragraph 48; other defects do not enlarge that power.

The submitted normative text contains no Presidential reserve preserving the 2026 method, inclusive-income entitlement or transition-debt exemption. Those choices need separate entitlement and fiscal evidence and are unnecessary to the narrow calculation-conformity contribution. The equality and land-floor alternatives below remain conditional research options, not requested conditions of adoption. Removing the reserve does not pretend that software can cure a missing legal rule: the developers must complete the lawful decision table and resolve any absence or conflict before first application. Under O‘RQ-682 Article 55, competent official interpretation may explain a subordinate rule but may not insert an amendment. Only the competent adopter may change the criterion or commencement. Existing awards, pending applications and recovery remain governed by their applicable legislation; this proposal invents no interim entitlement.

Existing controls, operational evidence and the incremental task

The following official materials were opened and checked on 1 October 2026. A legal requirement is distinguished from evidence that a service or activity operates. None of these materials contains the Agency’s full scoring-release test inventory or a measured capacity account.

Official evidence	Established scope	Narrow integration and limit
Resolution No. 35 annex 1 paragraphs 45–50	Protected data, assigned system/source responsibilities, limited outage power, oversight and disputes.	Reuse these actors and records. It is not evidence that an independently derived answer exists for every category branch.
Resolution No. 516, operative paragraph 6 ¹ ; annex 1 paragraphs 13 and 44	Required positive technical/security conclusions before implementation; joint connection tests; access to request counts, periods and statistics.	Incorporate rule-to-answer checks into applicable technical requirements and acceptance. Connection success alone does not prove correct category arithmetic. Do not replace the required external conclusions.

Official evidence	Established scope	Narrow integration and limit
Resolution No. 93 of 5 March 2026, operative paragraph 1 and annex paragraph 3	Ministry of Digital Technologies' IT-audit function, including infrastructure processes and change management.	Reuse applicable audit evidence and avoid a duplicate inspection. The act does not publish an Agency-specific scoring audit outcome.
Official portal, service 587	Existing application/result channel, no required documents, free service, stated one-month period and displayed status totals.	Use the existing channel. The observed page shows 640 876 total, including 16 564 in process; no accumulation window, decision-age distribution or handling times are stated. These are not annual arrivals, a deadline-breach count or available capacity.
Government report of 17 July 2026	Reports 2 000 unjustified refusals in 184 mahallas in one month and registry-related Presidential appeals rising from 30 000 to 46 000. Prosecutorial oversight was directed.	Supports access to case grounds and cause-specific review. It does not attribute the cases to software, prove the present incidence or measure this proposal's effect.
Urganch official report of 19 February 2026	A practical seminar on lawful registry inclusion/removal and data reliability took place.	Use existing training channels where suitable; a local event proves neither nationwide specialist readiness nor spare staff hours.

Additional contribution. The incremental contribution is the completed derivations and control cases linked to an independently justified answer, date and release result. Equivalent executed checks are reused. This removes duplicate technical work but does not itself establish normative coverage: the legal source is checked separately. Where both coverages are demonstrated, no additional norm is needed; where a legal condition is demonstrably absent, competent normative determination is needed in the principal act or a lawfully available instrument. General duties and constructed cases do not establish the marginal benefit of every clause.

Proportionate disclosure. Paragraph 7 links the operative methodology and dates through the existing official resource; paragraph 19 uses the existing applicant route for grounds and objections; paragraph 23 retains the protocol internally and applies existing lawful reporting. A separate pre-release or periodic aggregate report is no longer required. Where publication is already obligatory or lawfully authorized, an extract reuses the internal protocol and undergoes disclosure review. No claim of measured public-reporting benefit is used to justify a new duty.

Resources and delivery. Before the 1 December submission, the developers can reconcile the legal decision table and compare existing acceptance

documents with the supplied control cases under their existing drafting task. Before first consequential use from 1 January, the actual legal rule, required technical/security approvals and completed affected-path controls must be recorded. This is a dependency sequence, not a promised duration or a new power to defer commencement. No additional manual reserve is imposed on Inson officers; ordinary applications retain their statutory process. Testing runs in the authorized pre-deployment environment and does not add a verification appointment or document requirement for the family.

For any genuine additional task, the developer must identify the responsible existing contract or unit, deliverable, incremental hours, lawful funds and completion dependency. Operational timing evidence must identify its extraction period, channels, arrivals and completed cases, pending-case ages, processing times and relevant source delays; a cumulative website counter cannot provide those quantities. Additional per-application processing is introduced only with operational evidence and any necessary load test, rather than an assertion of spare staff. No performance benchmark of the author's small control program is presented as YAMIH throughput. Resolution No. 687 supplies conditional costing rules and PP-388 a budget framework, not a demonstrated project allocation. This proposal consequently neither states a zero incremental cost nor makes an unfunded nationwide reserve a binding delivery promise. The precise integration cost and Agency-wide timing remain unmeasured; the requested decision is the narrow reuse-and-gap task within the mandated draft, with any real extension separately costed before commitment.

Scientific and technical part: calculation task

This part is working technical material explaining the calculation requirements. The precise coefficients and boundaries of the 2027 multidimensional scoring model and real-family data have not yet been obtained. The completed audit of published calculation rules in current Resolution No. 35 is presented separately below. Symbols in the general formulas are not official criteria or category names.

In general, an approved rule is described as $C = g(F(x), q, v)$, where x denotes relevant inputs, q quality and exception states, and v the version applied. F need not be linear. Ministries' and agencies' current refusal and assistance-award rules are accounted for separately.

Only if the rule is additive,

$$S = \sum_j w_j z_j.$$

For justified closed intervals $z_j \in [a_j, b_j]$,

$$L = \sum_j \min(w_j a_j, w_j b_j), \quad U = \sum_j \max(w_j a_j, w_j b_j).$$

This interval is exact when inputs can independently take any rational value within their respective intervals. For discrete or dependent inputs, it is a conservative outer bound that may include unattainable categories. Bounds must have a methodological or data basis. If the interval spans several categories, calculation uncertainty is recorded. This calculation grants no power to assign a value in place of unresolved data or to refuse assistance.

The working program uses $C(S) = |\{t : t \leq S\}|$ for testing: equality belongs to the category with the higher index. This is only a test convention; equality, rounding, exceptions and direction in the official rule require separate approval.

Recalculation disagreement is

$$R = \frac{\text{number of category disagreements}}{\text{number of comparable cases}}.$$

For a sensitivity scenario,

$$F_s = \frac{\text{number of cases changing category}}{\text{scenario cases with both categories determined}}.$$

The report states the scenario, numerator, denominator, and excluded or unresolved cases separately. With a zero denominator, the measure is recorded as undefined.

The electronic computational supplement to Material 3 demonstrates an additive rule, exact rational arithmetic, closed intervals, boundary equality and comparison with a control category. It separately supplies the published-rule audit and independent arithmetic checks. The findings required to evaluate the proposed provisions are reproduced in this note; repository access is unnecessary.

Completed calculation audit and specific resulting proposals

Audit date: 30 September 2026. The exact inputs, control calculations and execution results are supplied in the electronic computational supplement to Material 3. The following table reproduces the principal findings. This audits published rules and constructed cases; it does not represent real-household observations or verification of the official 2027 scoring model.

Check	Computed result	Legal implication and limitation
Resolution No. 35, annex 1, paragraph 30: official example	6 480 000/5/3 = 432 000 soum; difference from published value: 0.	The example’s arithmetic was reproduced. Its May–July period for the September 2025 application is preserved; the calendar interpretation of the general period rule requires separate clarification.

Check	Computed result	Legal implication and limitation
Paragraphs 32, 33(a), 39(b): income exactly P	At $P = 715\,000$, both $D > P$ and $D < P$ are false.	For a new able-to-work applicant with no other refusal ground, no removal from a previous principal category and no hardship recommendation, paragraph 32 provides recognition, while paragraph 39 gives no matching category. Operational decisions were not checked. PF-258 paragraph 3 also uses strict $< P$.
Paragraph 27 land formula: constructed $(UM, QM) = (100, 90) \text{ m}^2$	$100 - 90 - \min(20, 200) = -10 \text{ m}^2$.	The algebraic condition $0 \leq QM \leq UM$ holds. Occurrence in real cadastral data, or exclusion by an additional restriction, has not yet been established.
One-month normative income for that land case	$-10/100 \times 0.035 \times 1\,360\,000 \times 1 = -4\,760 \text{ soum}$.	$M = 1\,360\,000$ is the official September 2026 value; mahalla coefficient 1 is only an expressly stated test assumption. The proposed zero floor gives 0, distinct from the current formula's result.
Male/female coefficients in paragraph 23	Difference in each of four territorial types: $0.4M = 544\,000 \text{ soum/month}$; monthly per-person contribution in a constructed four-person family: $136\,000 \text{ soum}$.	This is a difference in normative income contributions, not a measure of actual earnings, discrimination or incorrect assistance awards. September's M is not retrospectively applied to earlier months.
Extended land-formula control domain	For $UM = 100, 1000, 1001, 2000 \text{ m}^2$ and every integer $QM = 0, \dots, UM$: 4105 cases, 620 with negative area.	These are constructed counts, not the proportion of real families. For $UM \leq 1000$, negativity requires $QM > 0.8UM$; for $UM > 1000$, it requires $QM > UM - 200$.
Income interval for the hardship route	The income conditions in paragraphs 34–35 amount to $P < D \leq 2P$.	Recommendation, quota, qualifying family circumstances, reassessment and other lawful requirements are preserved. Putting ordinary D or reduced $0.75D$ into a general $[P, 1.5P]$ interval does not reproduce this separate route completely.

Check	Computed result	Legal implication and limitation
Paragraph 24 tax-based boundary and paragraph 28 goat calculation	For three-month tax total T and monthly base B_0 : $\max(2.5T/3, B_0)$, crossover $T = 6B_0/5$; 14 goats: 0, 15 goats: 34 000 soum/month.	Tax total and monthly base are aligned to the same period. The goat calculation uses coefficient 0.07 and exemption of the first equivalent head; other animals and operational rounding are not fully implemented.

1. Reconciling category boundaries. Annex paragraphs 5 and 12 include the equality case above as a mandatory test. The final policy and legal solution is determined together with the act of higher legal force. Replacing $<$ with $\leq$ through a technical setting is not proposed.

For discussion, if the option including equality in a principal category is selected, the income condition “**less than minimum consumption expenditure**” in PF-258 paragraph 3(a) and (b) and Resolution No. 35 annex 1 paragraph 39(a) and (b) is reconciled as “**not exceeding minimum consumption expenditure**”. The condition “**when below minimum consumption expenditure**” in PF-258 annex 1 note (a) is likewise changed to “**when not exceeding minimum consumption expenditure**”.

PF-258 paragraph 3(v) and Resolution No. 35 annex 1 paragraph 39(v) distinguish two income routes. Proposed criterion wording for discussion:

“The ‘family at the poverty boundary’ category shall distinguish:

families removed from the ‘state-supported family’ or ‘poor family’ category whose total average monthly income per family member, calculated without the hardship reduction coefficient, is above minimum consumption expenditure but does not exceed one and a half times that amount;

families

included on the recommendation of the ‘mahalla seven’ under the separate procedure for families in difficult life circumstances. In this route, income after the 25 per cent reduction must not exceed one and a half times minimum consumption expenditure; reduced income equal to or below minimum consumption expenditure shall not itself constitute grounds for refusing inclusion. Statutory requirements concerning qualifying family circumstances, initial assessment, recommendation, the prescribed quota and reassessment are preserved.”

The second route is reconciled with PF-258 annex 1 note (b) and Resolution No. 35 annex 1 paragraphs 34–35. Ordinary income and income reduced by 25 per cent are not compared as the same value. This author’s option requires the developer’s

assessment of entitlement and category effects, amendment of the Presidential act and reconciliation of other relevant rules; amendment of the Cabinet of Ministers resolution alone is insufficient. If another lawful equality solution is selected, its category, refusal and exception conditions must also be stated openly and consistently.

Additional control case after review, outside the original case list: let a constructed three-person single-parent family satisfying lawful recommendation and existing quota conditions, with no other refusal ground, have three-month income of 8 580 000 soum. Ordinary income is $8\,580\,000/3/3 = 2\,860\,000/3 > 715\,000$; reduced income is $(2\,860\,000/3) \times 3/4 = 715\,000$. Under paragraph 35(b), this reduced value does not exceed the upper bound. A universal lower bound $> P$ for all routes is therefore not used because it conflicts with this case. The two-route wording above addresses that problem. This control checks legal conditions; it does not describe an observed family's outcome.

2. Preventing negative area in land calculations. The area formula in Resolution No. 35 annex 1 paragraph 27 is proposed as:

$$TEM = \max\{0; UM - QM - \min(0.2UM; 200 \text{ m}^2)\}.$$

Here min selects the smallest and max the largest value in its brackets. *TEM* shall not be negative. *UM* and *QM* shall use the same unit. If data on either are unavailable or $QM > UM$, the data shall be clarified at the authoritative source; unknown or contradictory data shall not be replaced by zero. Clarification shall not introduce a new refusal ground based on that circumstance alone.”

This is a proposed normative amendment; it has not been confirmed that existing software already contains this floor. Obtaining the land-tax coefficient and other normative-income conditions are preserved. Application date, recalculation and effects on earlier decisions will be determined in the final act.

3. Clarifying periods and versions. Annex paragraphs 4, 6 and 8 require recording whether each value is monthly or a period total, the relevant calendar months and the parameter in force in those months. A complete migration calculation rule has not been implemented until the period for comparing a remittance with $2M$ in Resolution No. 35 paragraph 26 is clarified. Paragraph 19's rule applying the exchange rate on the date YAMIH receives the information requires preservation of that date and rate for replay.

The extended audit calculates two **conditional** readings separately; neither is presented as the Agency's operational algorithm. If compared q is monthly, for listed countries the move from $q = 2M - 1$ to $q = 2M$ lowers the monthly normative contribution from $3M$ to $2M$, a decrease of 1 360 000 soum. If q is interpreted as a three-month total, the same conditional change is from $3M$ to $2M/3$, a decrease of $9\,520\,000/3$ soum. For other countries the corresponding conditional decreases are 0 and $5\,440\,000/3$ soum. These are not assistance amounts. The developer must explicitly determine and legally and

scientifically justify the period and transition from a normative to an actual value at the boundary; a programmer does not independently introduce an additional minimum-income floor.

A zero floor in the land formula may increase a negative normative contribution. For September's M and test assumption $k = 1$, the maximum change in the monthly household-income contribution in the declared algebraic domain is 95 200 soum; the per-person contribution divides this by the number of family members. The proposal is not interpreted as automatically increasing assistance. Effects on current categories, payments and earlier decisions require separate replay using lawful data.

These results do not justify abolishing coefficients, reducing assistance or concluding that a particular percentage of families will change category. Such findings require the official model, lawful data in an authorized environment and a prespecified empirical examination.

Comparative account of current and proposed solutions

The subject of each current rule is briefly stated below; this is not a complete verbatim copy of legislation. The proposals will be reconciled with the rank and official wording of the final act.

1. Category and equality. Current sources: PF-258 paragraph 3 and annex 1 notes; Resolution No. 35 annex 1 paragraphs 32–35 and 39. Proposal: the two-route category wording above or another consistent equality solution selected by the developer. Basis: recognition and category conditions differ at income exactly P ; the separate legal conditions of the hardship route must be preserved. This option is not a mandatory condition for adopting the principal verification annex.

2. Land formula. Current source: Resolution No. 35 annex 1 paragraph 27. Proposal: the zero floor above and a verifiable source rule for areas belonging to the same cadastral object. Basis: negative area in the declared algebraic domain. Before applying a zero floor, cases in which calculated income may rise and effects on earlier payments are assessed; another geometrically meaningful solution, if chosen, must be stated reproducibly.

3. Result and calculation grounds. Current source: the SMS requirement in Resolution No. 35 annex 1 paragraph 37 and relevant decision rules. Proposed additional provision: “Together with the decision result, the applicant shall receive through the electronic account the calculation version, principal values and periods, reason for a normative value or exception, legal and factual grounds for the decision, and objection route. A person not using the account may obtain that information through an Inson centre. The SMS shall not replace this information.” Basis: new annex paragraphs 18–20, Article 24 of the personal-data law and applicable administrative procedures. Protected third-party data shall not be disclosed.

4. Calculation objections and council competence. Current source: Resolution No. 35 annex 4 paragraphs 26 and 31 limit the council's subject matter to documents of the 'mahalla seven'; paragraph 33 provides fifteen days for considering a complaint. No new general council power over automated calculations is inferred. Proposed YAMIH and Inson intake wording: "An objection to a decision based solely on automated processing shall be referred to the data owner or operator, who shall notify the subject of the result in writing within ten days. A complaint about a 'mahalla seven' document shall be referred to the appeal council within its subject matter. The original receipt date and appropriate referrals for different issues in one submission shall be preserved." Basis: O'RQ-547 Article 24. Amendment or supplementation of source data at the subject's request is due within three days under Article 11; identified inaccurate data must be corrected immediately. Those periods are distinct from the ten-day automated-decision objection period. If council competence is expanded, its subject matter, evidence-requesting, decision and execution rules require separate reconciliation; this proposal does not claim that such expansion has already occurred.

5. System outage. Current source: the temporary algorithm-change authority in Resolution No. 35 annex 1 paragraph 48. Proposed additional provision: "The legal basis, scope, start, restoration condition and calculations using the temporary version shall be recorded. On restoration, cases using that version shall be identified and verified under the applicable lawful rules." Basis: preventing outage authority from becoming a concealed permanent replacement of criteria; new annex paragraphs 11, 23 and 26. This addition does not expand existing authority.

6. Information exchange and payments. Subject of reconciliation: relevant information-exchange annexes to Resolution No. 35 and the award and payment rules in annex 3. Proposal: add source period, receipt time, quality status and decision version to exchange fields; do not link automatic stopping of lawfully awarded assistance to a new technical 'unresolved' status. Correction of previously calculated income, a new policy criterion and recovery of a payment are not treated as one event. The developer will add specific payment provisions to the official amendment table after comparing them with the selected criteria in the official 2027 draft; the present table is not represented as covering every assistance programme.

7. Existing responsibility and the additional verification procedure. Resolution No. 35, annex 1 paragraph 46, already assigns the responsible officials of the Agency's Information Technologies Centre responsibility for correct registry and YAMIH operation, module improvement and information exchange; the relevant ministries' and agencies' heads are responsible for timely and reliable replies. Paragraph 49 assigns oversight to the Prosecutor General's Office, the Agency's internal audit service and the Social Inspection. The proposal does not establish a new inspectorate or transfer their statutory powers. It specifies the evidence those existing responsibilities can

use: independently reproducible control calculations, version-specific acceptance, preserved periods and exceptions, unresolved-case counts, decision grounds and disclosable aggregate results. Those two paragraphs do not themselves prescribe that detailed protocol. This is a comparison with the identified provisions, not proof that equivalent duties or tools are absent throughout legislation or the operational system. The developer should identify existing equivalents, retain their authority and consolidate overlapping provisions; a demonstrated equivalent is a reason to avoid duplication, not to leave a distinct requirement unanswered.

Core verification annex: connection to existing duties

This comparison concerns the mandatory part of Material 1. The first column states the subject of an identified current provision; the second contains the author's proposed additional means of performance. This is an analytical mapping, not a verbatim comparison of the entire resolution. Paragraph numbers in the second column refer to the annex to Material 1.

Existing duty	Proposed performance	Verifiable need
Resolution No. 35, Annex 1 paragraph 46: correct operation of the Registry and YAMIH under legislation and technical documentation.	Paragraphs 4–7, 12–17, 25–26: linked rules, independent expected answers, component checks and acceptance of an identified version.	Establish conformity to the approved rule on the declared cases; matching totals or programs must not conceal component errors or a shared wrong answer.
Paragraphs 45–46: data protection and timely reliable replies from official sources.	Paragraphs 8–10, 21–22, 28: distinct data states, competent clarification, lawful authorization, supplied-code checks and limited retention.	Missing replies do not become zero; official-source responsibility is not transferred to the family and protected inputs do not leave for an external verification service.
Paragraph 37: result SMS. Personal-data law Article 24: explanation of automated decisions and a ten-day objection response.	Paragraphs 18–20: accessible calculation reasons, distinction between source, software and rule, original receipt and competent routing.	A family can identify and challenge the relevant ground; source correction is not replaced by a complaint about a mahalla document.
Paragraph 48: temporary power during disrupted exchanges. Paragraph 49: oversight within the listed bodies' powers.	Paragraphs 11, 17, 23–24, 27: temporary-version record, affected scope, restoration, internal protocol and lawful review of past decisions.	Temporary calculations remain identifiable; technical correction creates no independent ground to reduce or recover a payment.

Removing the optional equality and land-formula alternatives removes none of these verification duties. A demonstrated equivalent existing procedure is preserved and its provision identified when duplication is merged. This comparison approves no 2027 welfare criteria.

Three-column comparison table for selected provisions

The table uses the three-column structure in paragraph 85 of the appendix to O'RQ-682. Its first column includes only the phrase or calculation affected by the

amendment; other conditions are not repealed. It is a table of selected provisions in the author’s proposal, not the official developer’s final table covering all acts and assistance programmes.

Relevant part of current wording	Proposed wording	Grounds for amendment
PF-258 paragraph 3(a), (b), annex 1 note (a), and Resolution No. 35 annex 1 paragraph 39(a), (b): income “ <u>less than minimum consumption expenditure</u> ”.	For the selected inclusive option, replace that income phrase with “ not exceeding minimum consumption expenditure ”. Amend all listed Presidential and Cabinet-level parts together; preserve other conditions.	At income exactly P , for a new application under the selected conditions, recognition and principal-category predicates disagree. This is a policy option requiring separate cost and implementation assessment.
Resolution No. 35 annex 1 paragraph 35(b): income reduced by 25 per cent in the special route must not exceed $1.5P$; recommendation, quota and other conditions apply.	Distinguish ordinary and special reduced-income routes. In the special route, check $A \leq 1.5P$; $A \leq P$ shall not itself constitute a refusal ground. Preserve other lawful conditions.	A new universal lower bound $A > P$ conflicts with $A = P$ in the constructed three-person control case. The special route cannot be narrowed by a general interval.
Algebraic form of the relevant area calculation in Resolution No. 35 annex 1 paragraph 27: <u>$L = U - B - \min(U/5, 200)$</u> .	Proposed calculation, subject to the developer confirming the geometric meaning: $L = \max\{0, U - B - \min(U/5, 200)\}$. Areas must belong to one object and period; the normative rule must establish the floor, source and unit.	Negative results exist in the algebraic domain $0 \leq B \leq U$. A zero floor may raise calculated income; it is not a basis for automatically increasing assistance or recovering an earlier payment. Operational frequency is unknown.
Resolution No. 35 annex 1 paragraph 37: “An SMS shall be sent to the applicant’s mobile telephone number notifying inclusion of the family in the Registry or refusal of inclusion.”	Preserve this SMS requirement. Together with the decision, disclose the calculation version, principal values and periods, legal and factual grounds and objection route through the electronic account; a person not using it shall obtain the information from an Inson centre. Do not disclose protected third-party data.	A result notification does not fully disclose calculation grounds and objection procedure. Reconcile the proposal with Article 24 of the personal-data law and applicable administrative procedures.

Discussion, coordination and justification of references

This author’s proposal has not been sent to government authorities, subjected to public consultation on the government portal or officially coordinated with interested agencies. Independent workspace review provides calculation-quality evidence and is not interagency coordination. There is no evidence of agencies’

approval or opposition; the responses to objections address possible issues identified by the author.

Article 22 is the basis for drafting participation, scientific recommendations and specialist advice in operative paragraph 4. PF-193 identifies the mandate and scope. PF-258 and Resolution No. 35 identify the current category, calculation, application and temporary-authority rules discussed here. Those references do not authorize a lower-ranking act or technical instruction to replace a higher-ranking criterion. The personal-data and administrative-procedure laws justify the data controls, access to decision grounds and lawful objection route.

Implementation sequence and responsibility

Following competent approval of the methodology, the existing methodology, information-system and legal functions reconcile units, periods, boundaries, exceptions, effective dates and decision grounds. Independently justified control cases are included in the applicable technical approval and release process; equivalent completed tests are referenced rather than repeated. Technical acceptance under paragraphs 25–26 does not replace mandatory external conclusions. The approved description is linked through the existing official resource and the internal protocol retained under paragraph 23. Publication follows existing lawful duties or authorization; a new pre-release public report is not a launch condition. Statutory periods and the January commencement remain unchanged.

The authoritative source owner or operator resolves factual data problems, the system unit resolves software defects, and the methodology unit with the legal service prepares the lawful rule analysis. Where official interpretation or a normative amendment is needed, the question goes to the competent adopting body; Article 55 does not permit interpretation to insert amendments. The competent decision-maker changes an individual decision. Technical acceptance grants no power to approve policy criteria. The mandate and statutory periods cannot be postponed by an internal plan.

Implementation stages and completion evidence

Task and paragraphs	Responsibility	Artifact and completion condition
Methodology and change; 4–7, 12	Agency with Ministry; methodology unit and legal service	Rule passports and change matrix. Legal bases, dates, precedence and applicable paths are reconciled; software adds no missing rule.
Sources and quality; 8–10	Responsible Information Technologies Centre staff; source-agency heads within paragraph 46	Source map and quality journal. Each used field has a period, source, state and clarification route; zero differs from unknown.

Task and paragraphs	Responsibility	Artifact and completion condition
Control implementation; 12–17	System unit and expected-answer checker distinct from the implementation owner	Rule/case inventory, exact control answers and protocol. Executed coverage matches the declared inventory; consequential discrepancies are resolved and retested.
Explanation and objection; 18–20	Authorized Inson officer, data owner/operator and competent reviewing body	Accessible explanation example and linked referral record. Recipient, period and outcome are identified; route checking does not delay the lawful period.
Outage and restoration; 11, 23	Authorized officer and responsible system staff	Existing temporary-version record and restored calculations. Affected decisions are identified and differences resolved under lawful procedures; internal evidence is updated.
Resources and acceptance; operative 6–7, 25–26	Agency with Ministry; head or lawfully authorized deputy	Existing release record, required conclusions, test links and incremental task/funding evidence. No new manual-service capacity is presumed.
Retention and lawful disclosure; 21–24, 28	Authorized operator, protection staff and existing oversight	Existing lawful retention schedule and internal protocol. Any required or authorized disclosure is checked; no additional publication cycle.

Before the principal draft is submitted by 1 December 2026, reconcile its lawful decision table and map the completed controls to existing acceptance evidence. Before the affected rule is first applied from 1 January 2027, record its competent approval, applicable technical/security conclusions and affected-path conformity checks. This is a sequence of dependencies, not an estimated staffing schedule or authority to postpone commencement. Draft cases may be prepared in advance; definitive acceptance answers follow the approved rule. Additional integration work requires actual task and funding particulars before expenditure is committed.

Preliminary regulatory impact and financial justification

A0 — current procedure. Retain the current controls and statutory rights. Their legal existence is established; Agency-specific release evidence has not been obtained to determine coverage of the supplied cases. This is not a finding that existing controls fail.

A1 — technical execution of the legal basis. Include the derivations and cases in existing requirements and release records where the lawful rule is separately established. Reuse equivalent checks and channels; document uncovered work and resources. A1 is the preferred technical implementation, not a substitute for an absent normative basis.

A2 — minimum normative content of the mandated act. Incorporate necessary conditions of the new methodology and safeguards not secured by a

specific existing norm into the PF-193 draft. Choose Material 1's five compact paragraphs, equivalent wording or a retained applicable norm; A1 supplies technical execution. The full form is divisible. No separate manual service, new statistical programme or Presidential entitlement transition is proposed. This comparison is not the official impact report under O'RQ-682 Article 35 and PP-5025 paragraph 2(b).

Only identified incremental tasks are costed: legal reconciliation, missing expected-answer cases, affected integration or access changes, and their actual maintenance. Existing completed work and contractual coverage are recorded to avoid duplicate procurement or double counting. Agency units supply quantities, staff hours, operational evidence and contract scope; the Ministry identifies lawful financing. No delivered Agency integration, staffing surplus, cost total or savings has been measured. Existing software and supplied code do not establish zero cost.

Empirical verification of actual need requires separate research using lawful data. Its cost and results can be distinguished from the principal calculation-conformity test; unfinished empirical research is not presented as proof of correct targeting of assistance.

Evidence required for acceptance and financing

The verification annex is independently decidable from the optional equality and land-formula amendments. It requires a rule-to-case inventory, independently checked legal derivations of expected answers and component-level comparisons. A test list may not omit an applicable exception and then certify its own completeness. Missing or duplicate cases, unresolved component differences and zero comparison denominators must be shown. Identical totals cannot conceal offsetting errors. The methodology, software release and dated configuration have separately identifiable records, so a software repair under the same legal rule remains reconstructible.

The completed work supplies 37 regression tests and a checker of frozen case coverage. It does not supply production acceptance: Table 5 of the scientific paper identifies, for each rule family, the completed checks and the additional official-source, branch and rounding evidence needed. The ten primary-income rows and 4 105 land rows are constructed controls. None is counted as a household or used as a forecast of fiscal effects.

The developer's readiness protocol should identify the methodology unit, information-system unit and legal service, their accepted artifacts, applicable dates and unresolved matters. The resource account records work quantities, additional cash costs, staff hours, available capacity and funding for integration, controls, storage, access, training and reviews. Fixed and variable costs must not be counted twice. There is no invented budget total or saving. A later welfare study can be costed separately; statutory applicant periods cannot be extended because capacity is insufficient.

Technical background for the proposed control design: Barr et al., 2015, test-oracle survey and NIST IR 8397, sections 2.6–2.8. These are engineering references, not additional Uzbek legal obligations.

Expected results, consequences and checkable indicators

The immediate expected result is a described rule, checked control set and preserved individual grounds for every applied version. Execution is assessed by passports for applicable criteria, agreement between declared and executed test inventories, unresolved component discrepancies, explanation availability and compliance with statutory correction and objection periods. Rates disclose numerator, denominator and exclusions. These indicators check procedure performance, not accuracy of need identification. No arbitrary permissible error, stability or complaint-reduction percentage is prescribed.

Families are expected to gain access to the values and legal grounds used, correction at the competent source and no new refusal solely because of a technical status. Bodies must maintain the linked controls, explanations and reports and sufficient capacity. Correcting an error can change a lawful result in either direction; payment change, review and recovery require their own legal bases and a competent individual decision. Existing independent grounds for refusal, removal from the Registry and termination of payment remain. Constructed cases do not establish the number or fiscal value of those changes.

Practical risks include incomplete sources, wrong expected answers, an unprepared objection route, insufficient staff and identification through small groups. Corresponding controls are separate states and clarification (8–10), independent legal derivation and component checking (12–17), explanations and routing (18–20), protected authorization and reporting (21–23), and resources and written acceptance (operative 6–7, 25–26). A control program alone does not eliminate these risks; the implementation table specifies completion evidence.

Financial and economic account requirements

The principal draft's account covers rule description and legal reconciliation; source integration and quality fields; independent expected answers and tests; version records and protected retention; the electronic account and Inson service; staff training; reports and disclosure checks; and maintenance and revalidation. Each records one-off and annual volume, unit, additional cash cost per unit, staff hours, existing capacity, required increase and funding-source document. A staff post does not demonstrate spare capacity; reallocated work is shown separately from new cash expenditure.

The same accounting definitions as Material 3 apply:

$$K_{\text{first}} = K_{\text{setup}} + K_{\text{annual}}, \quad K_{\text{annual}} = K_{\text{fixed}} + \sum_r Q_r k_r.$$

Q_r is annual volume in the stated unit and k_r additional cash cost per unit; fixed and variable items are not counted twice. The Agency establishes quantities and capacity from its own records; the Ministry identifies lawful financing and budget arrangements. Independent welfare research and optional boundary amendments are costed separately. The final project cost is not determined because the approved work scope, module count, duration and funding allocation have not been supplied; published costing provisions are identified below. Neither zero cost nor a determined funding total is asserted; this specifies the evidence needed for operative paragraph 6.

Verified Agency-specific costing provisions

The consolidated Cabinet Resolution No. 687 of 28 December 2023, operative paragraph 3 and Annex 3, establishes a costing procedure for projects undertaken by the Agency's Information Technologies Centre with State Fund for Social Protection or Agency extrabudgetary funds. Its application depends on the actual performer and funding source; it is not a general tariff for every verification activity.

For technical support and improvement of information systems, Annex 3 paragraph 4 specifies the remuneration fund:

$$\text{MHTF} = 1.85 \times \text{MS} \times 16 \times \text{MHTEKM} \times \text{LAOOS}.$$

Here MS is the number of modules; LAOOS is the number of project months; MHTEKM is the statutory minimum remuneration, increased to account for social tax where the Centre is liable. The paragraph specifies other project-related costs at 5 percent of the remuneration fund. Paragraphs 3 and 7–9 separately address taxes and mandatory payments, Centre and administrative/support costs and profit; the remuneration expression is therefore not the total contract price. For projects covered by paragraphs 4–6, paragraph 8 caps Centre and administrative/support costs at up to 40 percent of the project cost determined under those paragraphs; staffing and pay terms are set by the Agency director's order. Paragraph 9 sets Centre profit at 2 percent of project costs. The percentages apply to their stated bases and project class, not indiscriminately to every work item. Paragraph 10 instead requires new-project pricing to follow technical requirements, duration and specialist categories and numbers, under an Agency director's order. Paragraph 12 makes the stipulated staffing and pay parameters costing conventions, not evidence of actual staffing or spare capacity. The work must be classified before the applicable provision is used; neither a module count nor a duration is assumed here.

PP-388 of 26 December 2025, paragraphs 19–21 and Annex 6, provides an Agency budget-programme framework. Those provisions establish a budgeting context, not an allocation for this verification proposal. The Agency and Ministry should link the final resource account to the applicable approved programme,

expenditure estimate and financing decision. This avoids treating aggregate social-protection expenditure as the price of a calculation-control module.

International materials and package languages

The proposal borrows no foreign legal provision and implements no new international treaty. OECD/JRC, Barr's test-oracle review and NIST guidance are engineering references on uncertainty and implementation checks; their adaptation to legal calculation is justified in Material 3. They supply no binding Uzbek coefficients or thresholds. Foreign materials for this subordinate proposal are disclosed to the extent relevant under unified-methodology paragraph 84; no foreign legislative model is claimed as proven optimal.

Russian is the primary language of the author's request and Materials 1–3. Article 6 of the appeals law permits state-language and other-language submissions. The Uzbek edition supports preparation of the official draft in the state language under Article 21 of O'RQ-682; English is an aligned companion. All three versions are reconciled for formulas, inequality operators, periods and powers. Substantive translation discrepancies are corrected before the developer submits the final version, rather than resolved by choosing a convenient text.

Evidence-based responses to objections

Because the official 2027 score specification has not been obtained for this project, accuracy or fiscal effects of the new model have not been calculated. That does not prevent an audit of published formulas or a duty to verify future approved calculations. If the negative land case cannot occur in operational cadastral data, that restriction is justified through the verifiable domain in the data specification; actual frequency is not claimed. If the hardship route is resolved operationally by precedence of a special rule, its legal basis and test case are recorded. Privacy is secured through lawful internal calculation and disclosure checks rather than sending personal data to the external author. A resource objection is addressed by actual cost calculation. If an existing rule covers the same requirement, the developer may identify the precise provision and consolidate the duplicated rule.

Procedural safeguards and the limits of an assurance

Existing powers and necessity. Legal coverage and executed controls are assessed separately. O'RQ-682 Article 20 restricts initiating the specified drafts where existing lawful mechanisms and administrative powers resolve the issue; PF-193 expressly mandates normative development of the new assessment. A test protocol cannot resolve an undetermined legal condition. An equivalent existing rule is retained, while technical integration uses existing powers. Material 1's five compact paragraphs or equivalent wording allow normative uptake without the full annex. Particular author clauses are not asserted to be automatically mandatory.

Admission of the submission. Article 40 of the Constitution protects proposals to competent authorities and requires their consideration under statutory procedures and periods. Articles 6, 18 and 23 of the appeals law distinguish formal requirements, acceptance and registration. Registration is required on receipt, or the next working day for receipt after working hours; refusal to register is prohibited. The covering request specifies the author, residence, recipient and issues. Articles 29–30 preserve specified grounds for leaving a submission unconsidered or terminating consideration, including anonymity or other statutory noncompliance, withdrawal and the defined conditions for repeated submissions. The present review cannot certify unknown facts about a future filing or earlier external correspondence.

Consideration and response. Article 23 of O'RQ-682 requires study of relevant research and submissions and generalization and use of proposals and scientific recommendations. Article 22 allows participation but does not require appointment. Under appeals-law Article 27, all issues must be considered and a written or electronic reply must give specific grounds; a requested clause-by-clause response makes that duty verifiable but is not a legislatively prescribed table format. The appeals law requires forwarding an out-of-competence submission within five days with notification and prohibits unjustified forwarding. Article 28 provides the proposal period of up to one month, except additional study with written notification within ten days. A personal participation or access request may require separate classification and its applicable period. The combined letter does not establish a binding judicial interpretation of that classification, and the additional-study exception is not assigned an invented final deadline.

Evidence of compliance. Preserve the submitted version, its attachments, the receipt or electronic confirmation, registration number and receipt date. Preserve routing and additional-study notices, any requests for further information and the complete reply. Compare the reply with the five numbered requests and with each substantive module: incorporation, amended solution, precise existing legal provision, or reason for nonacceptance. A source-file hash establishes which file was examined; it does not prove government receipt. The lawfully adopted act or official appointment decision is the evidence of those outcomes. None exists in this package merely because the drafts compile or the code passes tests.

Remedy for an unlawful refusal. Appeals-law Articles 32–33 provide a challenge to unlawful refusal to accept or consider and explanation of the review procedure; Constitution Article 55 protects judicial review of unlawful decisions, actions and inaction. Articles 185–189 of the Administrative Court Proceedings Code provide the applicable framework. Article 189 requires both illegality and infringement of the applicant's protected rights or interests for the stated remedy; the court may require a lawful decision, action or other cure. A reasoned policy disagreement alone is not proof of that infringement. Article 186 sets a general six-month court-application period from learning of the violation, unless another

statutory period applies; restoration requires a valid reason. This is distinct from the one-year period for a complaint to a superior body under appeals-law Article 22. An actual challenge requires the facts, classification, competent court and current rules to be checked at that time. No judgment ordering adoption of this proposal has been obtained or identified.

Scope of the legal conclusion. O'RQ-682 Article 23 makes discussion proposals advisory but requires consideration; Article 24 expressly permits rejection with reasons. The legal assurance supported here is the existence of the specified procedural duties, with their statutory conditions and remedies. It is not an assurance of appointment, access to restricted material, incorporation or adoption. Article 3 of O'RQ-457 excludes preparation and adoption of normative acts from its scope. Therefore the individual administrative-decision requirements cited elsewhere in this package are not presented as the procedural basis for compelling enactment; the proposed appeals-law route rests on the citizen's submission and the distinct constitutional and statutory duties described above.

Applicable procedure and judicial proof. Appeals-law Article 1 excludes submissions whose consideration procedure is established by other legislation. This covering letter is prepared as an unsolicited citizen proposal and personal request, not as a completed formal discussion submission. If the authority applies a special procedure, the requested reply should identify that procedure and its legal basis; the ordinary proposal deadline is not asserted for a subsequent portal comment under O'RQ-682 Article 24. No binding decision settling the classification of this mixed letter has been identified. This is an interpretation limit, not evidence that the author lacks the constitutional right to submit a proposal.

For a challenge within the applicable administrative-court procedure, Code Article 67 places the proof burden on the challenged authority or official, requires confirmation of facts relied on for objections and limits them to the grounds on which they relied in deciding or acting. The applicant still participates in collecting evidence within their capacity and must prove any claimed amount of damage. Supreme Court Plenum Resolution No. 24, paragraphs 17 and 20, explains the legality burden and states that the court does not assess the expediency of a decision or action lawfully left to administrative discretion. Paragraph 21 specifically explains the remedy for a written appeal not considered within the prescribed period: the court declares the inaction unlawful and orders consideration within a court-set period without predetermining the decision to be made. These rules support scrutiny of the actual grounds for refusal and compliance with applicable duties; they do not establish automatic success or a judicial duty to select the author's policy.

Legal sources and conditions for finalization

Mandate: PF-193, paragraphs 13–14. Existing mechanisms and audit formulas: Resolution No. 35 and annexes. Higher-ranking category basis: PF-258,

paragraph 3. Audit *M*: PF-115; *P*: National Statistics Committee, 4 March 2026. Drafting participation: O'RQ-682, Article 22. Data and automated decisions: O'RQ-547, Articles 11, 16–18, 24 and 28; special-data safeguards. Individual decision grounds: O'RQ-457, Article 54. Methodological source for sensitivity analysis: OECD/JRC Handbook, 2008, step 7.

Additional sources: PQ-5025, paragraph 2(b); O'RQ-682 appendix, paragraphs 11, 43–51 and 83–85. Analytical text uses 11–14 size type and normative provisions the 14-size main type, on A4 with left margin 3 cm, right margin 2 cm and top/bottom margins 2 cm. Liberation Serif is a disclosed substitute for Times New Roman; the developer must approve the official electronic form. No official LaTeX class is claimed to have been found.

This is an author's proposal; new duties are not presented as existing law. Finalization requires the official methodology, one official table of all selected amendments, cost calculation, implementation particulars and a human specialist's review of Uzbek legal language. This module does not complete the entire PF-193 mandate, particularly all service-referral rules. Adoption or absence of every legal objection is not guaranteed.
